

DULUS AI

\$DULUS Token Whitepaper

Autonomous AI Infrastructure on Solana

Version 1.0 • June 2026

1. Abstract

Dulus AI is an autonomous agent platform built to simplify how developers and non-technical users deploy, manage, and monetize AI-powered workflows. By combining multi-provider LLM support, a flexible plugin architecture, and offline-first capabilities, Dulus AI removes the vendor lock-in and complexity that currently limits AI adoption.

\$DULUS is the native utility token of the Dulus AI ecosystem, issued on the Solana blockchain. It powers access to platform features, incentivizes contributors, and gives the community a voice in the protocol's direction. This document describes the platform, its design principles, token mechanics, and intended development trajectory.

2. The Problem

The rapid growth of large language models has created a fragmented landscape. Developers and businesses face three persistent challenges:

- Vendor dependency — most AI tools are tightly coupled to a single provider, creating cost exposure and availability risk.
- Complexity of orchestration — building multi-step, multi-tool AI workflows requires significant engineering effort and expertise.
- Lack of ownership — users generate value through their data and workflows but have no stake in the platforms they rely on.

These barriers slow adoption, concentrate value in a handful of centralized providers, and leave most potential use cases unexplored.

3. The Dulus AI Solution

Dulus AI is designed around three core principles: provider neutrality, extensibility, and community ownership.

3.1 Multi-Provider Support

The platform supports major LLM providers interchangeably — including OpenAI, Anthropic, Mistral, and open-source models — allowing users to switch or combine providers based on performance, cost, or availability without modifying their workflows.

3.2 Plugin Architecture

A modular plugin system allows the community and third-party developers to extend platform capabilities. Plugins can add new tools, data sources, UI components, or agent behaviors, fostering a composable ecosystem rather than a closed product.

3.3 Offline-First Design

Dulus AI is built to function in low-connectivity or air-gapped environments, making it suitable for enterprise, edge, and privacy-sensitive deployments — a capability largely absent from cloud-native AI platforms.

4. The \$DULUS Token

\$DULUS is a utility token on the Solana blockchain. It is not an investment product and does not represent ownership in Dulus AI or any associated legal entity. Its purpose is to coordinate incentives within the ecosystem.

4.1 Token Utility

- **Platform access fees** — \$DULUS is used to pay for API calls, agent executions, and premium platform services.
- **Governance** — Token holders can submit and vote on protocol proposals, including feature prioritization, parameter changes, and ecosystem fund allocations.
- **Staking & rewards** — Users who stake \$DULUS contribute to network stability and are eligible to receive rewards from protocol-generated fees.
- **Premium access** — Holding a minimum balance of \$DULUS unlocks advanced features, higher usage limits, and early access to new capabilities.

4.2 Token Details

Parameter	Value
Token Name	Dulus AI
Ticker	\$DULUS
Blockchain	Solana
Total Supply	1,000,000,000 (1 Billion)
Token Standard	SPL Token
Decimals	9

5. Token Distribution

The total supply of 1,000,000,000 \$DULUS is allocated across five categories designed to balance community participation, long-term development, and market liquidity.

Category	Allocation	Vesting
Community & Ecosystem	40%	Released gradually through usage rewards and grants
Public Sale	20%	No lockup — available at launch
Team & Advisors	15%	12-month cliff, 24-month linear vest
Liquidity & Market Making	12%	Deployed at launch to ensure market liquidity
Reserve & Development	13%	Controlled by governance, multi-sig secured

Team and advisor tokens are subject to a vesting schedule to ensure long-term alignment. Reserve funds are governed by a multi-signature wallet and can only be deployed through a community governance vote.

6. Governance

Dulus AI is designed to transition progressively toward community governance. In the initial phase, core protocol decisions are made by the founding team with community input. As the ecosystem matures, governance will migrate to an on-chain model where \$DULUS holders can propose and vote on changes.

Governance scope includes: fee parameters, plugin approval and curation, ecosystem fund allocations, and protocol upgrades. Voting power is proportional to staked \$DULUS, with safeguards to prevent concentration of control.

7. Development Roadmap

The following phases represent the intended direction of the project. Timelines are indicative and subject to change based on market conditions, technical progress, and community feedback.

Phase 1 — Foundation

Platform launch, core agent framework, multi-provider integration, initial plugin marketplace, \$DULUS token generation event.

Phase 2 — Ecosystem Growth

Staking program launch, developer SDK release, governance module deployment, exchange listings, community grant program.

Phase 3 — Expansion

Mobile client, enterprise offline suite, cross-chain bridge exploration, third-party plugin certification program, DAO formalization.

Phase 4 — Scale

Decentralized compute layer, agent-to-agent marketplace, institutional API tier, expanded governance capabilities.

8. Risk Factors

Participation in the Dulus AI ecosystem involves risk. Prospective participants should carefully consider the following:

- **Regulatory uncertainty** — The regulatory treatment of utility tokens varies across jurisdictions and may change. Participants are responsible for ensuring compliance with applicable local laws.
- **Technology risk** — Software may contain bugs or vulnerabilities. Smart contracts and on-chain components are audited to reduce risk but cannot be guaranteed error-free.
- **Market risk** — The value of \$DULUS may fluctuate significantly. Token price is not guaranteed and past performance does not predict future value.
- **Competitive landscape** — The AI infrastructure space is evolving rapidly. New entrants or shifts in technology may affect adoption.

9. Disclaimer

This document is provided for informational purposes only and does not constitute financial, investment, legal, or tax advice. \$DULUS is a utility token intended for use within the Dulus AI platform. It is not a security, and holding it does not confer any ownership rights, dividends, or profit-sharing in Dulus AI or any affiliated entity. Nothing in this document should be construed as a solicitation or offer to buy or sell any financial instrument. Readers are encouraged to conduct their own due diligence and consult qualified professionals before making any decisions. Dulus AI reserves the right to update or revise this document at any time without notice.
